CURRENT CITY / BASELINE AND PROVENANCE

The new branch is authoritative for additions. Original 310-lot footprints remain a reconstruction until live-export validation.

CONFIRMED CURRENT BRANCH

Prototype corridor: X≈80, Z=180–460.

Four levels: Y=24 / 52 / 84 / 128 m.

Train on Y≈100 m; 4 cars.

Flying traffic: 38 / 65 / 114 m.

Existing building count: 310.

The V1 release is a prototype, not AAA acceptance.

PROVENANCE / LIMITS

Original footprints shown on this sheet are from a 2026-10-19 reconstructed candidate.

They are not a direct geometry/collision export of this branch.

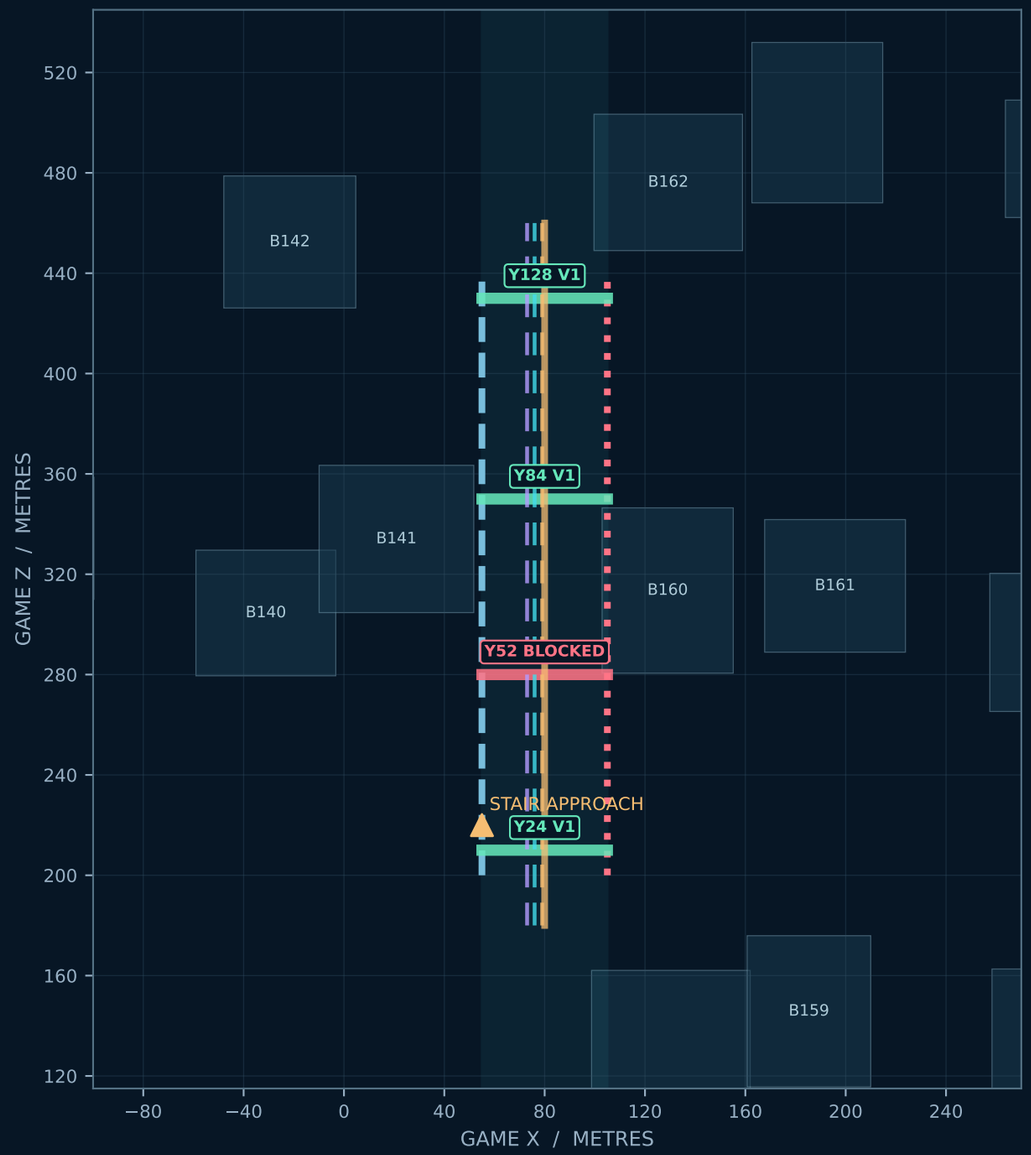

Older east-central proposal X=240–850 is RETIRED for V02.

This drawing is planning-grade; live runtime collision must be exported.

NOT FOR AUTOMATIC BLENDER PLACEMENT UNTIL LIVE WORLD-EXPORT MATCHES

CURRENT V1 / SITE CONDITIONS AND FAILURE MAP

As built in game_vertical_city.js / layout.json; accepted/rejected structures and incomplete walkable networks.

V1 ACTUAL ARCHITECTURE

Crossing Y24 / Z210: admitted.

Crossing Y52 / Z280: REJECTED.

Crossing Y84 / Z350: admitted.

Crossing Y128 / Z430: admitted.

Side galleries at X105 rejected; some terraces/supports rejected.

RECORDED IMPLEMENTATION GAPS

26 structures rejected by building clearance.

1,474 primitive pieces admitted; 952 collision boxes.

24 flying cars are scenic, with placeholder bodies.

Only the front train carriage uses the Hi3D model.

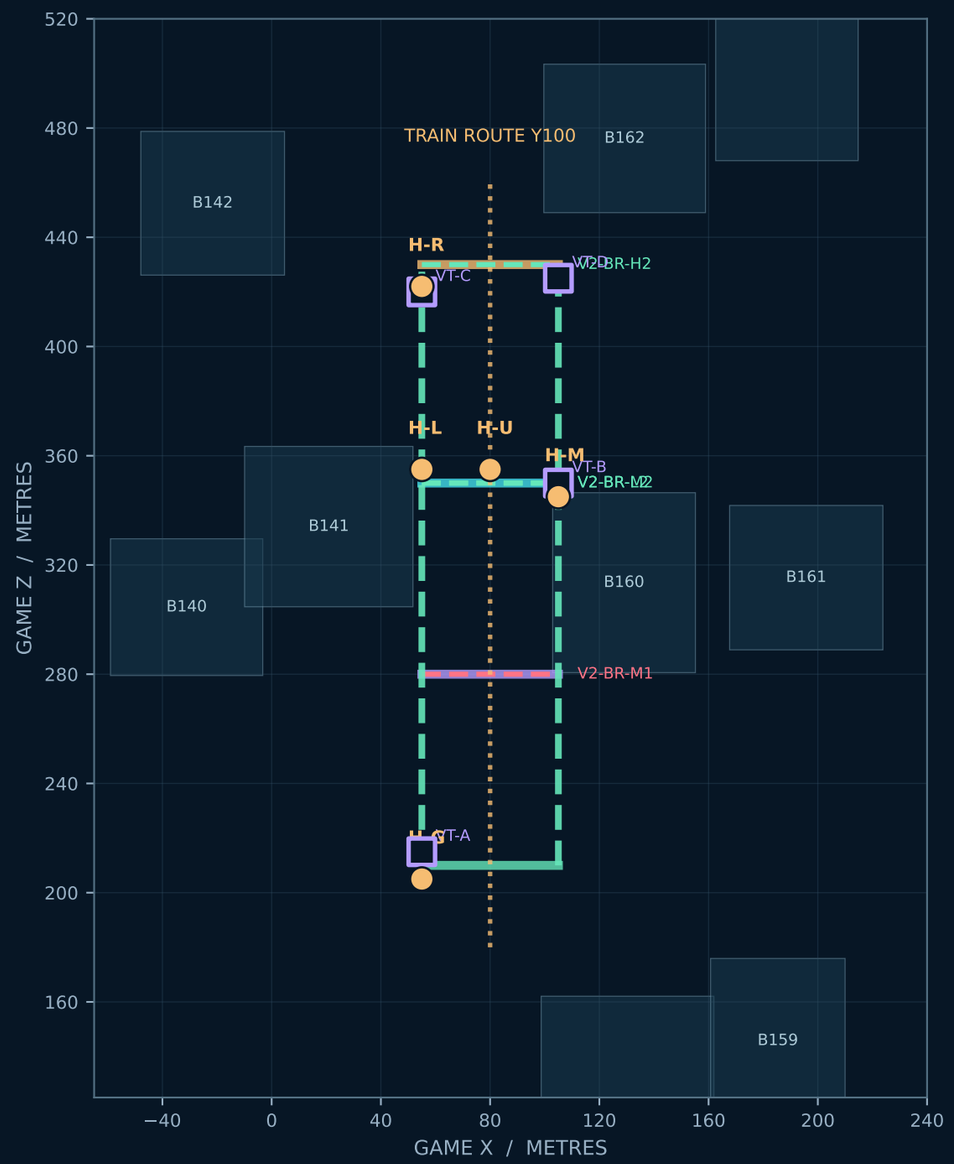

No finished continuous ground-to-upper-to-street playtest.

One sampled render is not sustained performance certification.

CRITICAL: V1 IS NOT YET AN INTERCONNECTED MULTI-ELEVATION PLAYER NETWORK

V02 PROPOSED / MULTI-LEVEL NETWORK SITE PLAN

Same X80/Z180–460 corridor. Proposals are not imported, collision-validated or approved yet.

NEW NETWORK INTENT

Three designed loop types: lower, mid and high.

Two walkable spines connected by cross-canyon paths.

Vertical transfer nodes at different Z stations.

A train-station destination with safe, fast and mastery approaches.

Four meaningful activity/encounter hubs plus rooftop landmark.

NOT CONSTRUCTION-VALIDATED

Red dashed bridge replaces V1 rejected Y52 span.

All X55/X105 spines must be segmented, stepped and fitted to actual facades.

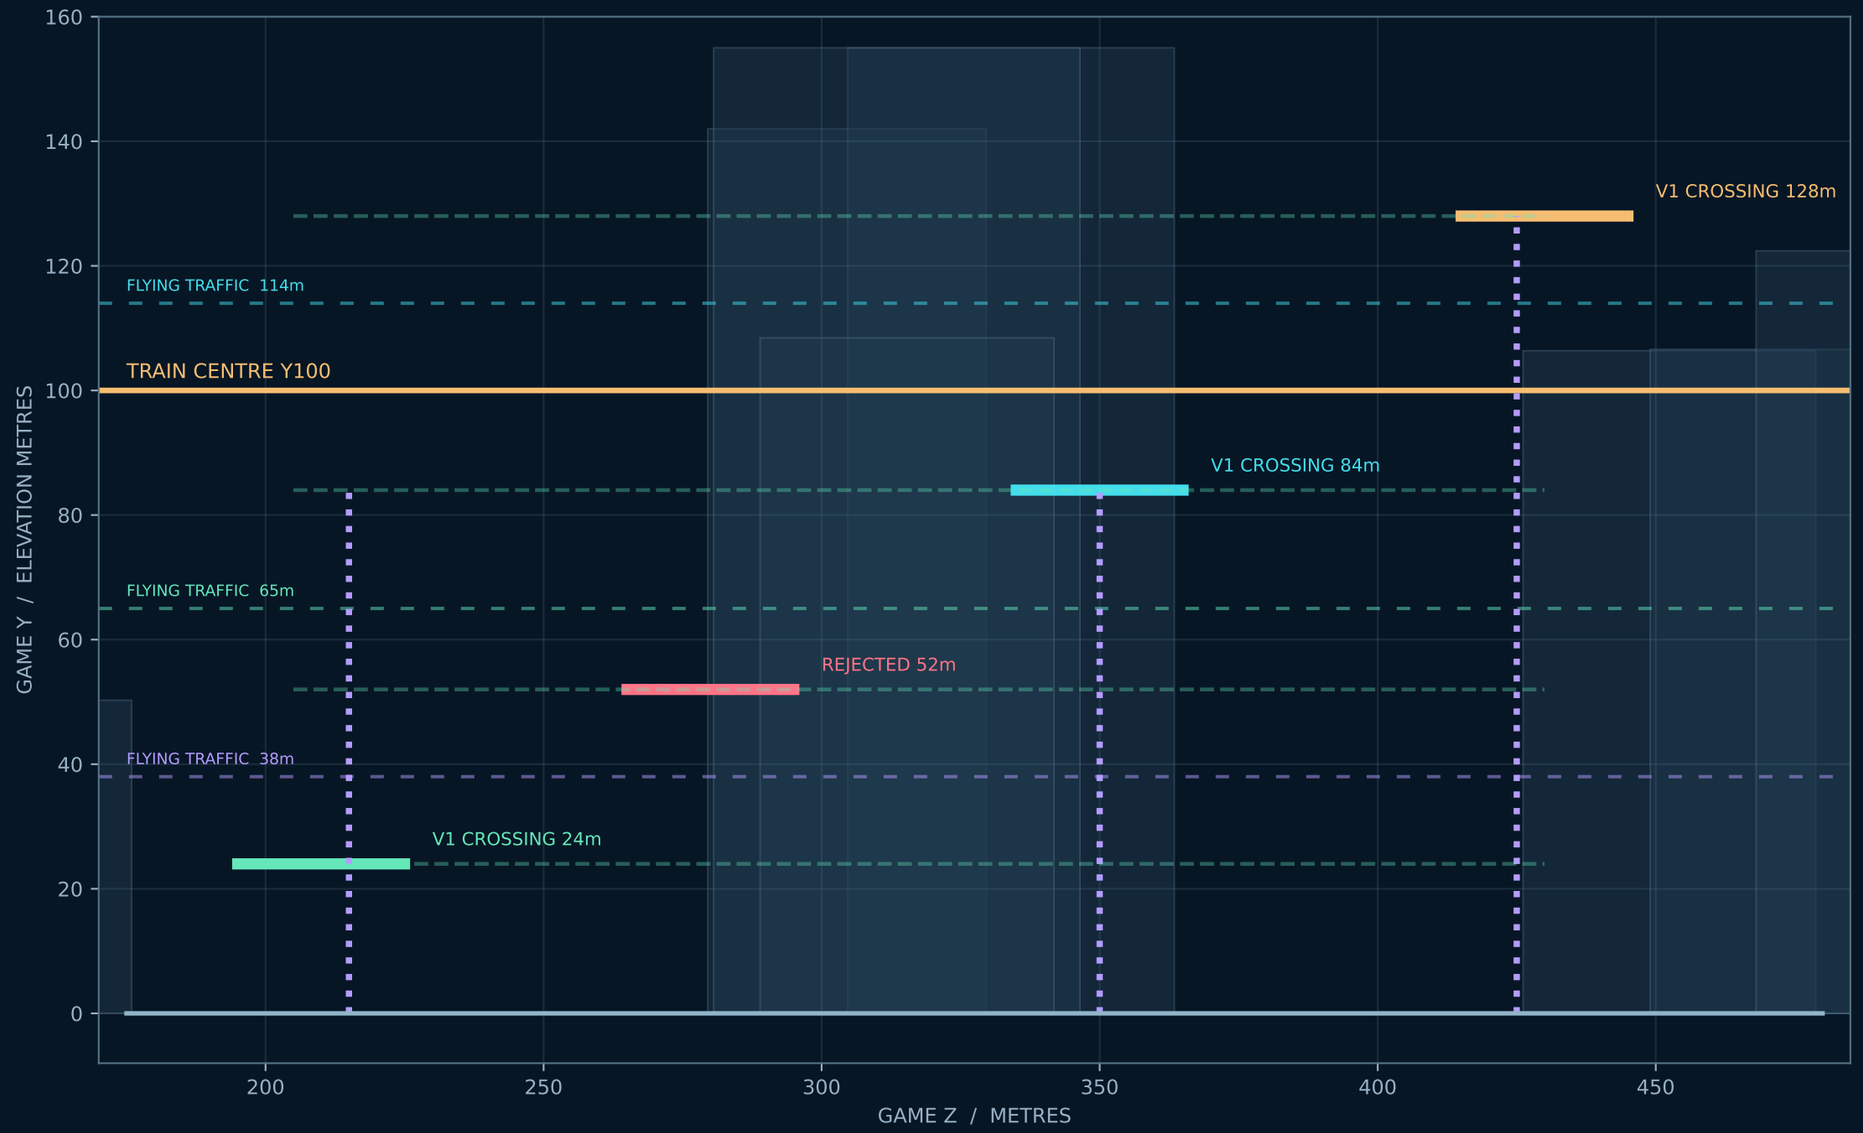

No bridge automatically inherits a doorway or an anchor.

Test collision, camera, drops, true Threadrail reach before modeling detail.

MINT = V02 LINKS / PURPLE = VERTICAL TRANSFER
YELLOW = LANDMARK OR DESTINATION

VERTICAL SECTION / EXISTING VS PROPOSED

Conceptual section looking along the corridor; elevations derive from the latest branch, extra routes are V02 proposals.

SECTION INTENT

Y0: retained road network.

Y24: accessible lower public loop.

Y52: service combat / retail middle loop.

Y84: upper walkway and transfer loop.

Y100: moving four-car transit.

Y128: rooftop gallery / high-speed routes.

CLEARANCE WARNINGS

Y100 train and Y114 traffic share 14m vertical separation before envelopes.

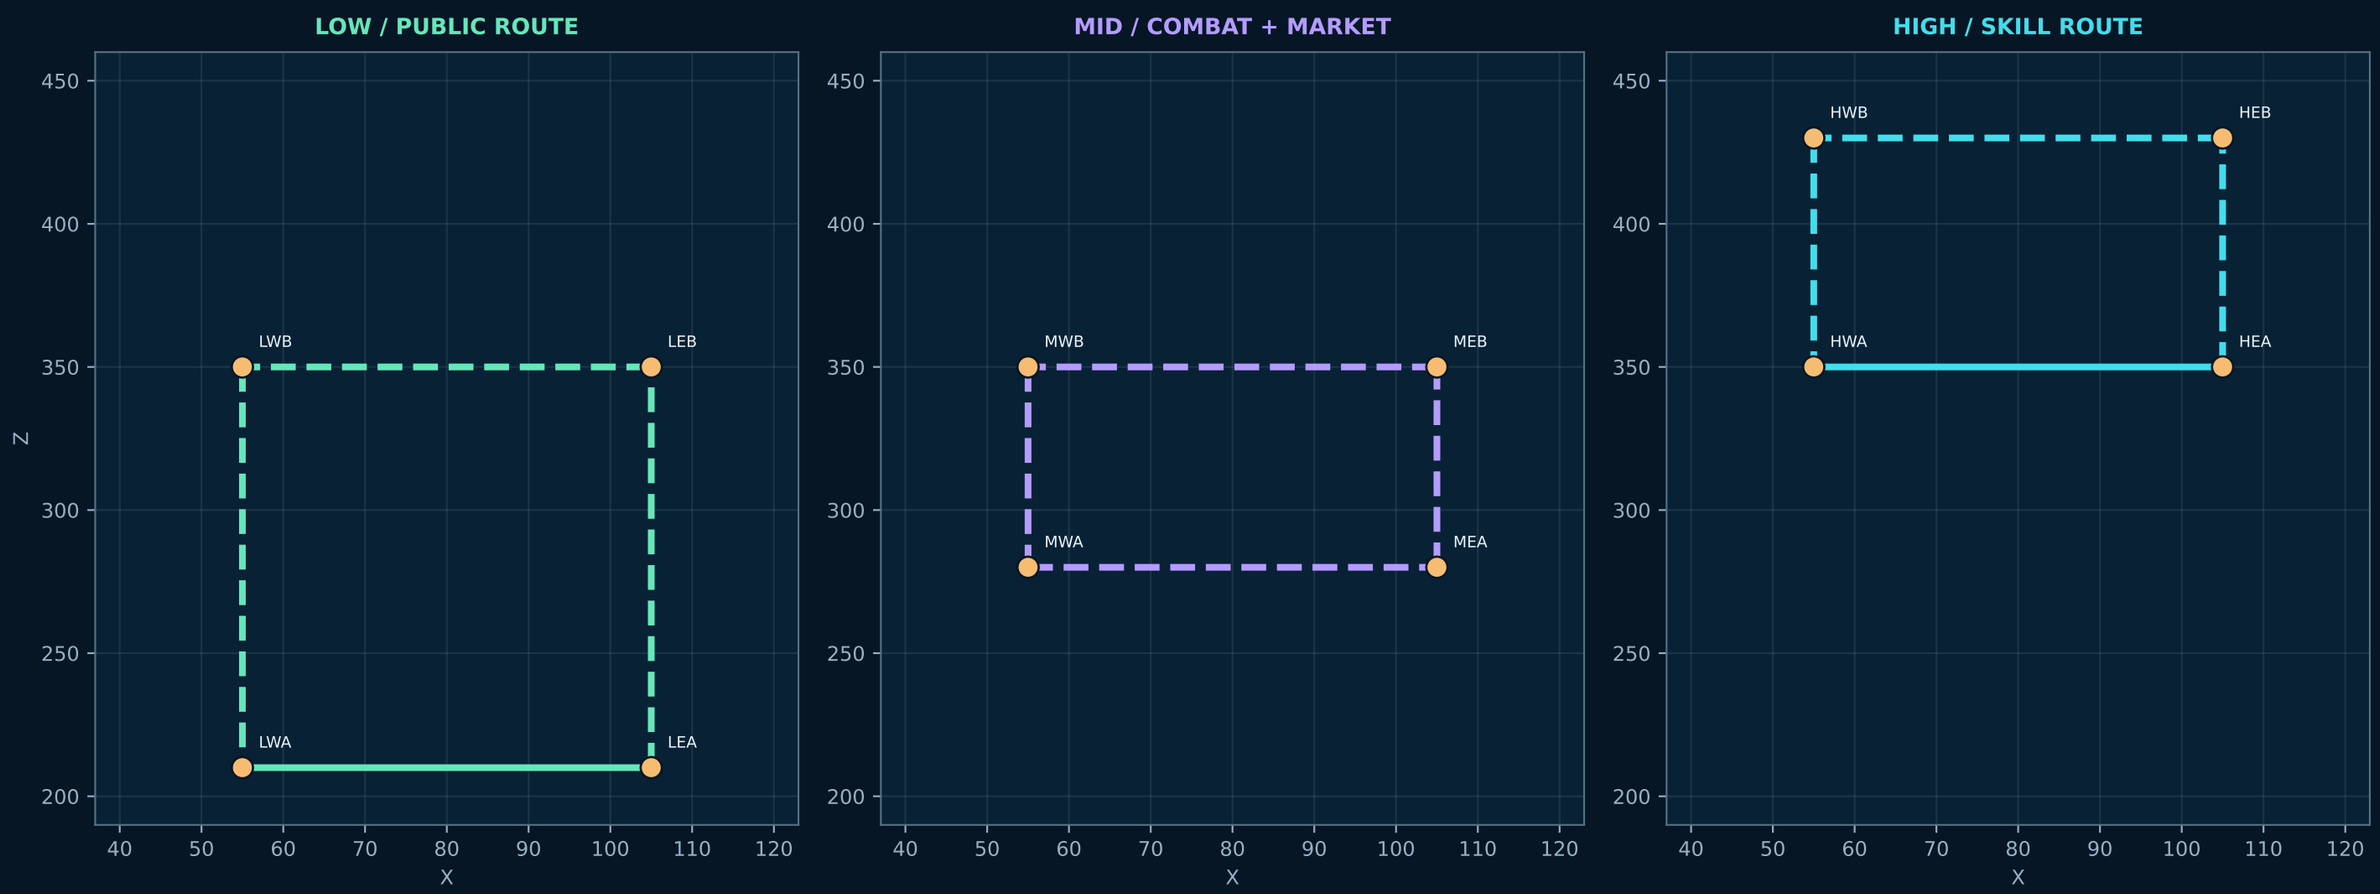

At Y84 upper bridges, Y65 and Y114 traffic need swept clearance.

Y52 crossing currently rejected by existing building collision.

Drawn facades are reconstructed proxies only.

AAA QUALITY GATE / PLAYABLE MOVEMENT LOOPS

Proposed network topology: three complete loops, two-way transfers, player choice; every edge remains untested.

SAFE ROUTE: walk, stair and lift links, no banked impulses required.

FAST ROUTE: Threadrail shortcuts with valid physical anchors and momentum checks.

MASTERY ROUTE: higher-risk Rail Pop + Afterstep sequences with designed recovery.

Graph closure is DESIGN INTENT — not evidence of traversable runtime geometry.

DESIGN READINESS / CONFLICTS AND ACCEPTANCE

No claim of equivalence to Spider-Man, GTA V or Arkham Knight; benchmark their design principles and validate player routes.

GATE	CURRENT STATUS	REQUIRED CORRECTION
01 Reference accuracy	LIVE-WORLD EXPORT	V1 reconstruct is not authoritative; 310 old envelopes must be reconciled
02 Real buildability	26 V1 REJECTIONS	Existing building intersects Y52 bridge and galleries/supports
03 Connected traversal	FAIL / NOT YET TESTED	3 loops exist only as V02 graph; surface support/clearance pending
04 Player agency	NOT IMPLEMENTED	3 destination paths: safe, fast, mastery with no-resource fallback
05 Encounters	MISSING	Chase/transit, service-yard combat, civilian-gallery rescue
06 Landmarks / navigation	PROPOSED	Transit gate; suspended market; service yard; high roof
07 Transport	PARTIAL	Moving four-car train; only front hi3d mesh, near traffic scenic
08 Threadrail rules	LIMITED	6–100m physical span / max 55deg / validated anchors required
09 Player recovery	NOT TESTED	Missed-landing surfaces, public lift and return loops required
10 Game acceptance	NOT MET	No uninterrupted controlled traversal nor matched 60s performance sample

RELEASE GATE: Verify current runtime geometry, V02 3D routes, swept clearances and normal-control traversal before detailed Blender construction.

DESIGN BENCHMARK: movement-aware block scale (Spider-Man) • believable districts (GTA V) • multi-system encounters (Arkham Knight).
